

RENOLIT WATERPROOFING EXCELLENCE IN ROOFING

RENOLIT WATERPROOFING

EXPERIENCE IN ROOFING MEMBRANES. alkor**PLAN**®

The alkorPLAN® membranes are based on monomeric PVC-P. Although these membranes are traditionally installed on flat roofs, they are now commonplace on pitched and barrel vaulted roofs due to its flexibility and aesthetic qualities and is used in the waterproofing of new buildings and refurbishment projects.

The alkorPLAN membranes have six main advantages:

Cost-effectiveness

- Economies on the installation costs: one single 30m² roll replaces 6 bituminous rolls in a 2 layer system.
- Economies on the structure costs: the waterproofing is 5 times lighter than the traditional multilayer systems.
- Economies on the maintenance costs: generally limited to bi-annual inspections.

Fire Safety

- No naked flame during installation
- Fire retardant membrane

Aesthetic

- Adaptable to most roof substrates.
- A broad colour range.
- Integrity of the seams.

Physical properties

- Vapour permeability
- Flexibility
- Static and dynamic perforation resistance.

Durability

• Life expectancy assessed by the BBA (British Board of Agrément) as in excess of 30 years

Recyclable

 PVC can be recycled and be reintroduced into the production process in order to preserve valuable resources. After their service life, the old PVC roofing membranes can be collected and recycled into new raw material.

The **RENOLIT** roofing division, aware of its ecological responsibility, participates in the ROOFCOLLECT® collection and recycling programme.

Hardi (Denmark)

Shopping Centre (Russia)

Reduced installation time

As the alkorPLAN® waterproofing membrane is a single layer of highly developed material it significantly speeds up the installation process, which will result in identifiable cost savings in installation time.

For example, to replace 1 roll of 30 m² of alkorPLAN®, at least 6 rolls of a traditional bituminous multilayer membrane are needed.

Light weight

The weight of the product is one of its major advantages. The membrane is between 20 to 40% of the weight of some traditional multilayer systems. The weight ranges from 1.6 kg m² up to 3.3 kg/m², depending on the thickness of the membrane.

One roll alkorPLAN® of 30m² = 6 rolls of tradional bituminous multilayer system

Limited Maintenance

The maintenance required by the alkorPLAN® waterproofing system is limited: in most cases, a visual inspection and routine clearing of gutters and outlets is all that is required.

The alkorPLAN® membranes provide the building owner with a long term cost effective solution and contribute to the durability of their buildings.

Museum of Art (Denmark)

The integrity of the seams

The aesthetic benefits of alkorPLAN® would be lost if the roofs showed seams and joints similar to those in the majority of traditional systems.

alkorPLAN® provides a very smooth appearance to the roof, which is appreciated by architects and building owners alike.

Selective colour range

RENOLIT has developed a range of colours which provides an opportunity for the architect to create a roofscape which is both distinctive and effective:

Standard colour

Light grey 71004

ALKORDESIGN® colours

The colour availability will depend on the geographic location of the building. Please refer to the **RENOLIT** technical department for further advice.

Adaptability to all supports

The alkorPLAN® membranes can be adapted to a wide variety of roof shapes. They permit the architect to consider the application and use on buildings where the roofs are of a challenging and architecturally interesting nature.

Theatre (The Netherlands)
A very interesting example of the alkorPLAN®
"copper" colour. Please note that only the main hall
has been waterproofed with alkorPLAN® membranes,
the rest of the building is covered with real copper.

4 RENOLIT WATERPROOFING 5

Vapour Permeability

The alkorPLAN® membranes are not only waterproof, but are also permeable to vapour. This allows the roof to "breathe" (upto 15 times more permeable than most other traditional bituminous multilayer systems).

Suited for Refurbishment

Thanks to its vapour permeability, the product is particularly suited for roof renovations. In the majority of cases, instead of having to remove the defective waterproofing, it is often only necessary to install the alkorPLAN® waterproofing system over the existing one. A proportion of the water inside the old roofing system will diffuse through the membrane over time

Sport Hall (Italy)

Fire resistant roofing membrane

The alkorPLAN® roofing membranes are fire retardant. Further to this, there are no naked flames during the installation. A roof with alkorPLAN® waterproofing membranes is installed by means of hot air welding. All activities within the building can in this way be continued without any risk for the people inside .

Trade entertainment Center (Russia)

Flexibility

Every building is subject to structural and thermally induced movements. The alkorPLAN® membranes will accommodate normal building movements, however in the case of designed movement joints, a specific homogeneous alkorPLAN® membrane will be specified.

International University Campus (France)

Durability

The extreme durability of **RENOLIT**'s products has been tested in practice: alkorPLAN® has been in use since 1972! Below there are some examples of roofs that have been proven to perform well.

Transport station (Slovakia)

6 RENOLIT WATERPROOFING 7

RENOLIT WATERPROOFING alkorPLAN® SYSTEMS

MECHANICALLY FASTENED SYSTEM

Pressure plates and screws to approved specification are fastened along the edge of the roof sheet, through the insulation into the roof deck. This system can be used for new build or refurbishment.

BALLASTED SYSTEM

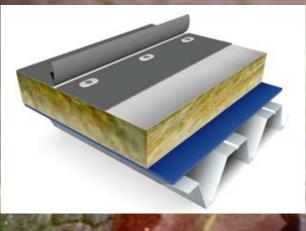

ballast, paving slabs or green and garden roof planting

ADHERED SYSTEM

The membrane is fully or partially bonded. It is particularly suited to roof refurbishment as some membranes can be bonded directly onto old bitumen or felt.

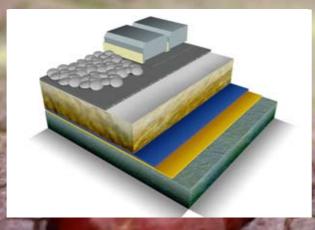

ALKORDESIGN® SYSTEM

ALKORDESIGN® simulate the appearance of standing seam and lead roll roofs without the weight and expense of aluminium, zinc, copper or lead, and the heavy duty roof structure required to support them. The profiles are welded to the alkorPLAN® roofsheet, providing the aesthetic appeal of a seamed or rolled metal roof with all the advantages of single ply.

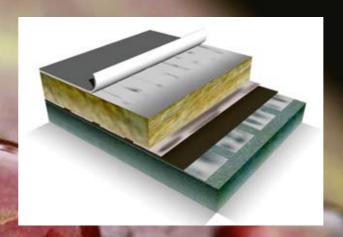

Zara (Spain)

Printing Office (France)

RENOLIT WATERPROOFING

alkorPLAN® SYSTEMS

GREEN ROOFS

Over the substructure you have an adhered vapour control layer, a bonded insulation board, followed by the waterproofing membrane which is also adhered. Then follows a gliding layer, drainage layer and water retention layer. The substrate layer is then added ensuring both feeding substances and water supplies of vegetation and the oxygen and anchoring of the roots to the layer of plants that finish this system.
